# TECHNICAL MEMORANDUM 

DATE: March 17, 2016
TO: Boston Region Metropolitan Planning Organization (MPO)
FROM: Seth Asante and Katrina Crocker
RE: Federal Fiscal Year (FFY) 2016 Priority Corridors for Long-Range Transportation Plan (LRTP) Needs Assessment: Selection of Study Locations

## 1 BACKGROUND

This memorandum presents the results of Task 2 of the work program for Priority Corridors for LRTP Needs Assessment: FFY 2016. ${ }^{1}$ Task 2 of that work program-to select study locations-includes presenting the results to the MPO for discussion.

The existing needs for all transportation modes in the MPO region were identified as part of the Needs Assessment of the LRTP. ${ }^{2}$ The LRTP Needs Assessment guides the process of deciding which projects to fund in future Transportation Improvement Programs (TIPs). Some of the current mobility requirements of the MPO region listed in the current LRTP Needs Assessment are:

- Maintaining and modernizing roadways with high levels of congestion and safety problems
- Increasing the quantity and quality of walking and bicycling
- Improving the efficiency of transit service and adherence to schedules

Based on previous and ongoing transportation-planning work-including the MPO's Congestion Management Process (CMP) and MPO planning studiesMPO staff identified several priority arterial roadway segments that require maintenance, modernization, safety improvements, and mobility improvements, and listed them in the LRTP Needs Assessment. To address problems of some

[^0]of these arterial segments, a study was included in the federal fiscal year (FFY) 2016 Unified Planning Work Program (UPWP). ${ }^{3}$

By focusing on arterial segments rather than intersections, planners can evaluate multimodal transportation needs comprehensively (with the goal of creating "complete streets"). A holistic approach to analyzing problems and forming recommendations ensures that the needs of all public transportation usersincluding pedestrians, bicyclists, and motorists-are considered. Ultimately, this will result in roadways where it is safe to cross the street and walk or cycle to shops, schools, train stations, and recreational facilities, and where buses can run on time. Typically, the recommended improvements are within a roadway's right-of-way. They take into account the needs of abutters and users, and the interests and support of stakeholders.

## 2 SELECTION PROCEDURE

The study selection process consisted of three steps. First, MPO staff assembled data about the arterial segments that are identified in the current LRTP and used them to screen the roadway segments. Next, MPO staff examined the arterial segments more closely by applying specific criteria. Finally, staff scored each arterial segment and assigned a priority of low, medium, or high to each segment.

### 2.1 Gathering Data

MPO staff identified 54 arterial segments in 39 municipalities in the MPO region. The assembled data are:

- The Massachusetts Department of Transportation (MassDOT) 2014 Road Inventory File and 2009-13 crash database - used to assemble the following information for each arterial segment in each municipality: roadway jurisdiction, National Highway System (NHS) status, average daily traffic (ADT), high-crash locations, and crash rates
- MPO Congestion Management Process data on arterial congestion - used to determine average travel speeds, travel time index (travel time in the peak period divided by travel time at free-flow conditions), and speed index (average travel speed divided by the speed limit) on each arterial segment
- MPO data on gaps in the bike network and MassDOT bike facilities - used to identify bicycle needs, including connectivity, and accommodations

[^1]- Data on MBTA bus service performance and passenger load - used to determine the percentage of bus trips that do not adhere to the schedule (in other words, that provide late service) or do not adhere to passenger load standards (resulting in crowding)
- Data on MBTA bus routes, subway lines, and commuter rail lines - used to identify which segments serve MBTA buses or stations
- Data on the Boston Region MPO's Environmental Justice (EJ) transportation analysis zones - used to identify EJ areas
- Data selected from MassDOT's project-information database; the MPO's FFY 2016-20 TIP projects; MPO planning studies and other studies; and municipal websites - used to obtain data on projects, studies, and TIP projects that are planned or programmed for each arterial segment

Table 1 (at the end of this memorandum) presents, for each arterial segment, the data and information gathered for this study, including the municipality, MAPC subregion, jurisdiction, MassDOT district office, crash rate per million vehiclemiles traveled, number of top-200 high-crash locations, number of crash clusters that are eligible for Highway Safety Improvement Program (HSIP) funding, travel time index, transit service performance, whether the segment is located in, or within a half mile of, an EJ transportation analysis zone, and a list of relevant studies or projects. It also includes the score and priority rating that were determined by applying the selection criteria. The processes for scoring and assigning priority ratings to segments are described below.

### 2.2 Applying Criteria

MPO staff examined the arterial segments more closely by applying the following six criteria:

- Safety Conditions, 0-4 points (each of the four criteria is worth 1 point)
o Location has a higher-than-average crash rate for its functional class
o Location contains an HSIP-eligible crash cluster
o Location is on the list of the Massachusetts top-200 high-crash locations
o Location has a significant number of pedestrian and bicycle crashes per year (two or more per mile) or contains one or more HSIP-eligible bike-pedestrian clusters
- Congested Conditions, $0-2$ points (each of the two criteria is worth 1 point)
o Travel time index is at least 1.3
o Travel time index is at least 2.0
- Multimodal Significance, 0-3 points (each of the three criteria is worth 1 point)
o Location currently supports transit, bicycle, or pedestrian activities
o Location needs to have improved transit, bicycle, or pedestrian facilities
o Location has a high volume of truck traffic serving regional commerce
- Regional Significance, 0-4 points (each of the four criteria is worth 1 point)
o Location is in the National Highway System
o Location carries a significant portion of regional traffic (ADT is greater than 20,000 )
o Location lies within 0.5 miles of an EJ transportation analysis zone
o Location is essential for the region's economic, cultural, or recreational development
- Regional equity, 0-2 points (each of the two criteria is worth 1 point)
o Location is in an MPO subregion for which there has not been a priority-corridor study
o Location is in an MPO subregion for which there has been a priority-corridor study in the previous three years.
- Implementation Potential, 0-3 points (each of the three criteria is worth 1 point)
o Location is proposed or endorsed by its roadway administrative agency
o Location is proposed or endorsed by its MPO subregion and is a priority for that subregion
o Location has strong support for improvements from other stakeholders

### 2.3 Scoring and Rating

Arterial segments that have a total score of 10 or fewer points were rated low priority; those with a score of 11 to 12 points were rated medium priority; and those with a total score 13 or more points were rated high priority. Eleven arterial segments were given a high-priority rating by MPO staff based on safety, operations, multimodal and regional significance, regional equity, and support from agencies and municipalities. The availability of funding determined the number of segments selected.

The high-priority segments were then examined more closely, and arterials that had projects meeting any of the following criteria were excluded from further consideration for this cycle of the priority-corridors study: recently completed, in construction, in design, under study, or programmed in the TIP. Figure 1 shows the general locations of previous priority-corridor studies, and also shows that the arterial segment selected for study is located in a subregion in which there has never been a priority-corridor study. Based on this evaluation, the segment described below was selected for study.

## 3 ARTERIAL SEGMENT SELECTED FOR STUDY: ROUTE 1A AT VINNIN SQUARE AREA IN SWAMPSCOTT, SALEM, AND MARBLEHEAD

MPO staff recommend that the corridor that includes Route 1A and ancillary streets in the Vinnin Square area of Swampscott, Salem, and Marblehead be selected for study. The Towns of Swampscott and Marblehead and the City of Salem requested this study via MPO outreach for the UPWP. Those municipalities asked the MPO staff to perform this study to identify problems related to recent and future developments expected in the area, and then to identify solutions that could be implemented in tandem with MassDOT. The MassDOT Highway Division District 4 Office and the North Shore Task Force expressed their support for and willingness to participate in a study of the selected arterial segment.

## 4 SUMMARY

The recommended arterial segment and its ancillary streets meet the selection criteria of this study, especially by supporting the transportation improvement priorities of the MPO's LRTP. While the work scope for this study assumed that "as many as two" arterial segments would be selected, the MPO staff does not propose studying a second arterial segment because this study will include ancillary streets (Loring Avenue, Essex Street, Vinnin Street, and Salem Street) in three municipalities, which would require considerable resources for evaluating alternatives (possible improvements).

Staff will present this recommendation to the MPO for discussion and approval. If the MPO approves this corridor selection, staff will meet with officials from Swampscott, Salem, Marblehead, MassDOT, and MAPC to discuss the study specifics, conduct field visits, collect data, and perform various analyses.

## 3 XE®F13 DUAFISDURQ

intersection of Salem St and Vinnin St, for a mixed-use or multi-family development under 40R smart growth regulations that could see up to or over 100 units. No plans have been filed but development concepts are being put together currently.

## STUDY AREA - ROAD SEGMENTS

We are looking for a technical study of the Vinnin Square area to identify problems and solutions that can be implemented in tandem between MassDOT, the City of Salem, and the Towns of Marblehead and Swampscott.

The area includes the primary Route 1A (Paradise Road) as well as feeder/arterials (many of which include additional lighted intersections). See the following map for reference. The street segments are:

- 330 Paradise Road north to Loring Ave intersection in Salem
- Essex Street/Loring Ave (from Stop \& Shop signal east to Maple Ave, Salem)
- Vinnin Street (from Loring Ave east to Bank of America access)
- Salem Street (from Vinnin St south to Sunbeam Ln)

# Initial Scoping Meeting Summary <br> Route 1A-Vinnin Square Priority Corridor Study in Marblehead, Salem, and Swampscott Swampscott Town Hall, First Floor Conference Room <br> May 5, 2016 

## Meeting started at 12:00 Noon.

Participants from the City of Salem, the Towns of Marblehead and Swampscott, MassDOT Office of Transportation Planning (OTP), MassDOT Highway Division’s District 4 Office, and Central Transportation Planning Staff (CTPS) introduced themselves (see attached meeting roster).

## Study Background

Mark Abbott of CTPS introduced the Boston Region Metropolitan Planning Organization (MPO) and the study background.

- The study is supported by funding from the MPO. The MPO is responsible for conducting federally required metropolitan transportation planning process. The work of the MPO is conducted by CTPS, staff to the MPO.
- The MPO's Long-Range Transportation Plan (LRTP), Charting Progress to 2040, identified needs for all modes of transportation in the MPO region. The LRTP identified arterial segments where roadways need improvements and modernization.
- The objectives of this study are to identify safety, mobility, access, and other transportation-related problems in the corridor and to develop multimodal solutions to the problems, including increasing the quantity and quality of walking and biking.
- CTPS went through an extensive and comprehensive process and selected this corridor from over 54 arterial segments in the MPO region for study.

## Overview of Study Area

Seth Asante of CTPS provided an overview of the study area based on available transportation data. The area's roadway characteristics are summarized as below:

- Functional class: Principal urban arterials (Route 1A and Tedesco Street), minor arterial (Essex Street and Salem Street).
- Jurisdiction: MassDOT has jurisdiction over Route 1A in Salem and Swampscott; the Town of Swampscott has jurisdiction over Essex Street and Salem Street; the City of Salem has jurisdiction over Loring Avenue off of Route 1A and Vinnin Street; and the Town of Marblehead has jurisdiction over Tedesco Street.
- Route 1A and Tedesco Street are on the National Highway System.
- All of the roadways are two-lane, two-way undivided roadways.
- There are ten signalized intersections and several unsignalized intersections and major commercial driveways in the study area.
- Generally 30 mph is the speed limit on the roadways in study area.
- There are sidewalks on both sides of the roadway but few locations are missing sidewalks
- Generally, the study area's roadway has no shoulders or dedicated bike lanes.
- The adjacent land uses are mixed—residential, commercial, recreational, and educational.

## Study Vision

Seth Asante said that based on previous discussions with some of the advisory tasks force members, the visions include:

- Transform Route 1A and ancillary roadways to increase safety for all users
- Renovate the study area's roadways into a pedestrian friendly boulevard
- Upgrade the traffic system to be more efficient
- Create a walkable, livable community that promotes human interaction

## Study Tasks

Seth Asante presented the limits of the study area. Seth Asante provided an overview of each of the tasks that will be performed in this study, which are described below:

- Collect data: The data to be collected include traffic volumes, pedestrian and bicyclist volumes, vehicle speeds, crashes, traffic signal timings and sequence, and transit service data. MassDOT Highway Division will collect all the traffic volume and speed data and provide the signal timings and intersection layout information. The Massachusetts Bay Transportation Authority will provide transit service data.
- Existing conditions analyses: the analyses would include inventory of the corridor land uses, pedestrians and bicyclists needs, safety conditions (crashes involving vehicles, pedestrians and bicyclists), traffic signal equipment essentials, peak hour traffic operations analyses, and spot speed survey.
- Forecast future traffic: Use the regional travel demand model set to forecast 2040 traffic. The model was calibrated for 101 cities and towns in the MPO region and adopted for the Long-Range Transportation Plan.
- Develop and analyze improvements: Work in conjunction with the study task force to develop improvements and concepts that would reconfigure the roadways to improve safety and operations and make the roadways safer, convenient, and comfortable access for all users.
- Document the study and present products of the tasks to the advisory task force for comment and feedback. Prepare draft document for review and finalize report

Seth Asante said the study is expected to be completed in 12 month. Mark Abbott thanked the advisory force members for their participations and welcomed any suggestions or comments after the meeting via e-mails or phone calls.

Meeting was adjourned at 1:00 P.M.

# Route 1A-Vinnin Square Priority Corridor Study in Marblehead, Salem, and Swampscott <br> Presentation and Discussion of Existing Conditions and Improvements Salem City Hall Annex, 120 Washington Street Third Floor Large Conference Room 

October 24, 2016
Meeting Summary

## Meeting started at 10:30 A.M.

Participants from the City of Salem, Towns of Marblehead and Swampscott, MassDOT Office of Transportation Planning (OTP), MassDOT Highway Division's District 4 Office, and the Central Transportation Planning Staff (CTPS) introduced themselves (see attached meeting roster).

## Study Background

Mark Abbott of CTPS introduced the study and the objectives and informed participants that CTPS went through an extensive and comprehensive process to identify safety, mobility, access, and other transportation-related problems in the corridor. Mark said that CTPS staff has developed multimodal solutions to the problems.

## Existing Conditions

Seth Asante of CTPS presented the data collected for the evaluating the existing conditions. They include traffic volumes, spot speeds, crashes, and transit performance data. Seth Asante said that based on analysis of existing conditions, field reconnaissance, and input from the previous meeting the following problems were identified in the study area:

- Wide roadways, which creates inequity by placing too much emphasis on vehicular use and encourages higher vehicle speeds.
- A lack of shoulders or bike lanes makes the roadways uncomfortable for bicyclists and places the sidewalks close to the travel lanes.
- A lack of crosswalks at some major intersections and side streets challenges pedestrians and put them at risk.
- Non-compliant ADA curb ramps and sidewalk connectivity problems (gaps) create an unfriendly environment for pedestrians and for people with disabilities.
- A lack of bus shelters at the stops with high number of rider creates problems for riders, especially during inclement weather.
- High vehicular speeds and acute horizontal curve on Route 1A near Leggs Hill Road results in many crashes.
- Outdated signal-timing plans need to be updated to make the flow of traffic efficient throughout the study area.
- High volumes of traffic on Route 1A and Vinnin Street creates congestion at Vinnin Square and Swampscott Mall area.
- A Lack of turn lanes and traffic queues causes high number of crashes on Route 1A at Swampscott Mall, Vinnin Square, and between Harrison Road and Sumner Road in Salem.
- The numerous driveways at Vinnin Square and a lack of trees and greenery do not provide a welcoming environment for pedestrians and bicyclists and contributes too many crashes.

## Improvement Alternatives

Seth Asante provided an overview of the 2040 traffic projections and said that traffic on the area's roadways are expected to grow by about five percent between 2016 and 2040. Seth Asante presented the multimodal improvements that CTPS staff developed to address the problems. He said CTPS staff will work with the advisory task force and use their feedback to refine the improvements. Seth Asante said that most of the improvements and concepts fall within the existing roadways right-of-way width and they require no land takings and they would make the study area's roadways safer and more attractive to pedestrians and bicyclists while serving the needs of commuters, supporting economic activities, and livable communities. Seth Asante said a few of the improvements and concepts would require more space to build the improvements and they would involve land takings.

## Comments and Feedback

There was a discussion after the presentation and the task force provided feedback including adding an alternative with a median for the Route 1A segment at the Swampscott Mall, converting shoulders into bike lanes, and refining the land use map. Seth Asante thanked the advisory task force members for their participation in the study and welcomed any suggestions or comments after the meeting via e-mails or phone calls.

Meeting was adjourned at 12:00 PM.

| Subject: | Comments on CTPS Vinnin Square study |

Hi Seth and Mark,
Please find below OTP's comments on the Vinnin Square study:

- Route 1 A is mislabeled on some of the introductory figures (follows Paradise Rd., not Essex St.)
- We encourage you to not treat the parking allowance at the medical facility on Paradise Rd. in Swampscott (near Oakledge Rd. and Franklin Ave.) as a constraint for improvement concepts. Any changes to that allowance can be considered by the state at a later date. A crosswalk should be considered across Paradise at Oakledge Rd. to accommodate individuals parked on that side street.
- Ensure report includes recommendations from projects and studies detailed on Figure 13
- On Figure 18, "traffic congestion and queues at signalized intersections" is putting it a bit strongly for the Loring Ave. segment in Salem (red). Of the three intersections and three peak periods (nine instances), only one instance is LOS D - the rest are A or B. Congestion and queues seems to be incongruent with the other problems identified.
- Tie the new sidewalk at the Loring Street curve, the curve warning signs, and the reduced speed limits with explicit desire to improve safety at this location.
- Consider third leg of crosswalk at Harrison Rd. given future site of an elementary school. Pedestrians from Lincoln Rd. would need to cross Harrison Rd. to access school if using sole crosswalk across Loring Ave.
- Strongly favor Alternative 1 for Paradise Rd. at Swampscott Mall. Alternatives 2-4 do not have any bicycle accommodations.
- Show existing crosswalk at SE leg of traffic island at intersection of Vinnin St. and Paradise Rd. in all alternatives.
- So why no bicycle provisions proposed for stretch of Paradise Rd. at Vinnin Square? If unable to reduce from 4 traffic lanes given need for multiple lanes at intersections demonstrate in report. No bicycle provisions here breaks up consistency in bike lanes along Loring Ave. in Salem and Paradise Rd. in Swampscott.
- Similarly, Loring Ave. at Vinnin Square also does not show bicycle provisions despite there seeming to be some space in ROW. This rendering should show existing parking and evaluate future concepts. Understand the high number of curb cuts complicates things here but the three legs of the Vinnin Square triangle on Figure 28 don't seem to have been developed to the same scrutiny as the other segments.
- Good job on the examples of different improvements. This is something we had asked for before so wanted to note its inclusion.

And one last note - I noticed Ben Wood from DPH's name on the sign-in list yesterday. How was he included on the study? Just curious - we work with Ben and DPH on other studies and I was surprised to see his name there.

Thanks,
Michael

RE: Feedback on "Route 1A-Vinnin Square Priority Corridor Study" Initial Feedback

Seth:

Thank you for letting us provide feedback on the initial materials CTPS has developed as part of the Route 1A-Vinnin Square Priority Corridor Study that was presented to Swampscott, Salem, Marblehead, and MassDOT on Monday, October 24.

I've met with DPW, Fire, and Police in Swampscott in order to put together the below comments which we're hoping can be considered as you put together the draft study report. The comments here are broken down based on the Figure \#s from the pages presented at the meeting.

- Figure 2 Study Area Map

0 The portion of Vinnin St between Loring Avenue and Paradise Road was missing its highlight.
o The 1A marking is displayed on Essex St in Swampscott but should be on Paradise Road in Swampscott. This correction needs to be applied on all subsequent maps.

- Figure 3 Roadway Jurisdiction Map

0 Sunbeam Lane (off of Salem St in Swampscott) should be indicated as "Other" since it's a private road.

- Figure 8 Designated Speed Limit and Summary of Spot Speed by Direction

0 There's a portion of Paradise Road colored for " 35 mph ". The Town had MassDOT change that to 30 mph.

- Figure 14 General Land Use/Zoning Map
o There's an area south of the pink "Commercial/Retail" area currently shown as "Park/Recreational" but is actually "Residential" (specifically the lands abutting the roads of Mountwood Road, Parsons Drive, and Alyward Drive (all in Swampscott).
- Figure 25 Proposed Improvements Paradise Road from Ellis Street to Longwood Drive

0 We'd prefer the shoulders to be bike lanes
0 The Town currently allows (along with MassDOT okay) parking along the north side of the street for 250 Paradise Road (in front of their building and the parking lots on either side of building). This would have to be balanced against the need for bike lanes.

- Figures 26-28 Proposed Improvements Paradise Road to Swampscott Mall
o We prefer Option 1 far more than the other two options
o Medians are not a viable alternative due to the restriction they create on general drivers for left turns but also primarily the fire safety limitation it presents.

0 Add a Rectangular Rapid Flashing Beacon at the mid-block pedestrian crossing.
o Pedestrian crosswalks for all commercial and multi-family driveway egress points on this portion.

- Figure 30 Proposed Improvements Essex Street and Loring Avenue South of Vinnin Street
o We'd prefer the shoulders to be bike lanes.
Please let me know if you have any questions about the feedback provided here. We look forward to the next step in this study.

Sincerely,

S. Peter Kane

Director of Community Development

CC: Interim Town Administrator

Hi Seth - I met with the Police Chief, DPW Director and the Town Administrator to go over the plans we have the following comments

In favor of sidewalk on the northside Tedesco from Marblehead into Vinnin Square and geometry changes at Brookhouse Drive.

Salem bridge at Legg's hill road and Loring Ave (small bridge program?) should be rebuilt

Crosswalk at Tedesco should be re located to location where people from the parking lot across Tedesco St. are going. they will cross there should be in most convenient location

The town already put in the Rapid Flashing beacon and crosswalk FB on Tedesco at Legg's Hill road we also and also put in a crosswalk at Legg's hill road. As is suggested in the plan.
Attached are two mark ups one is to show the area marked as Tedesco country club but it is a vacant parcel of land which has a n overlay district in both Marblehead and Salem that allows for a high density development 30 units per acre.

The second mark up show the driveway on Tedesco street into the staples shopping area. This is a difficult place to take a left into or out of there is poor visibility and if it could be widened to create a turning lane.

Along paradise road the town prefers the option of looking at with a median and breaks in between with one lane in each direction to improve pedestrian environment.

Hi Seth,

Thanks for sending the OTP and Town of Swampscott comments. In general we agree with these comments. Here are some specific comments.

- The minimum bike lane width is five feet. Please include this width for all recommendations with bike lanes.
- Sidewalks and bike lanes are required on both sides of the roadway. The District would only support alternatives meeting this criteria. Alternatives for improvements through Vinnin Square should conform to this requirement if possible.
- Try to avoid utility pole relocations when proposing alternatives. Example - Where there are existing 5 foot sidewalks we could widen them to six feet to the outside of the existing surface. We would not relocate the poles just to add sidewalk width. Any additional pavement surface should be dedicated to the bike lane/shoulder.
- In areas that are high crash locations the recommendation should be to conduct an Road Safety Audit (RSA). The information in this report could be considered as part of the RSA.

Hi All,
I wanted to share with you the comments from OTP and Town of Swampscott (attached) so you can review them.
Thank you,
Seth

| Subject: | Vinnin Square Comment |

Seth,
Thank you for coming to present the CTPS plan for the Vinnin Square area. I have a few comments below - I am a Salem resident and member of the Parking \& Traffic Commission and Bicycle Advisory Committee, but these comments are only my personal observations, I hope that the city will have a chance to weigh in with its own official position soon.

First of all, I appreciate the attention you gave to the importance of lane width in maintaining safe travel speeds, its impact on pedestrian crossing distances, and impact on safety for bicyclists.

Nevertheless, on this and future projects, I encourage CTPS staff to devote analysis and presentation time addressing the criteria which are outlined in its own long-range plan - those of Safety, Preservation, Capacity, Clean Air/Communities, Equity, and Economic Vitality. In the presentation at the city, I heard a lot of discussion of safety, capacity, and preservation of the system, but very little discussion of equity, economic vitality, or clean air \& clean communities. Merely designing roadways which adhere to ADA and basic MassDOT guidelines is not adequate - that is a floor, not a ceiling. We need to hear some intense, carefully considered analysis of those criteria and ways to address them, especially considering that $17 \%$ of Salem households do not own cars.

I have a few specific recommendations on the plan which I hope you have time to consider, starting with two recommendations relative to the planned move of the Horace Mann school. Safe Routes to School needs to include bicycles, and roadways and intersections near the school should be designed with children as design users, safe enough that they can navigate their way to school independently.

To that end:
Intersection of Lincoln Rd. and Loring - This is a key connection to off-street paths which lead to the Marblehead rail trail and future Canal Street path, and in turn, connects to many quiet, safe, neighborhood roads. Making this crossing safe for kids, so they can enter the school property with having to ride on 1 A itself, will effectively open up a huge swath of Salem and Marblehead neighborhoods so that they have safe, convenient access to the new school.

1A north of the new Horace Mann site, to where it connects with Jefferson \& Loring reconstruction, should likewise be constructed to the same standard. This will ultimately allow people to make safe connections from many more nearby neighborhoods. This is a good place for the city to consider a protected bike lane.

- On "deadman's curve," pedestrians are currently on the exposed side of the guardrail. This needs to be identified and corrected, preferably while moving bicycle lanes to the protected side of the guardrail as well. Both on deadman's curve and south of it, in the areas where no parking is currently allowed, the appropriate treatment here is definitely a raised, protected bike lane, not just striped shoulders. The state struggles to implement protected bike lanes in areas where parking removal is a political obstacle, so when you have a section of road where that isn't any issue - why not just do it?
- In general, throughout the project area, any shoulders which are intended for bicycle travel should be striped as bike lanes, otherwise people will drive on them.
- In areas throughout the project where roads can be narrowed for safety, communities should consider the benefits of actually removing pavement rather than just re-striping, so as to reduce the burden on city stormwater systems and improve the health of Salem sound through the resultant reduction in non-point-source pollution.

Thanks again for your consideration of these comments.
Regards,
Eric Papetti

Cycle Length: 90
Actuated Cycle Length: 90
Offset: 0 ( \(0 \%\) ), Referenced to phase 4:NBTL and 8:SBTL, Start of Green, Master Intersection
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 1.06
Intersection Signal Delay: 41.5
Intersection LOS: D
Intersection Capacity Utilization 93.9\%
ICU Level of Service \(F\)
Analysis Period (min) 15
~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
\# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
\(m\) Volume for 95 th percentile queue is metered by upstream signal.

\section*{APPENDIX G}

\section*{MassDOT Highway Division Project Development Process}

\section*{Overview of the Project Development Process}

Transportation decision-making is complex and can be influenced by legislative mandates, environmental regulations, financial limitations, agency programmatic commitments, and partnering opportunities. Decision-makers and reviewing agencies, when consulted early and often throughout the project development process, can ensure that all participants understand the potential impact these factors can have on project implementation. Project development is the process that takes a transportation improvement from concept through construction.

The MassDOT Highway Division has developed a comprehensive project development process which is contained in Chapter 2 of the MassDOT Highway Division's P roject Development and Design Guide. The eight-step process covers a range of activities extending from identification of a project need, through completion of a set of finished contract plans, to construction of the project. The sequence of decisions made through the project development process progressively narrows the project focus and, ultimately, leads to a project that addresses the identified needs. The descriptions provided below are focused on the process for a highway project, but the same basic process will need to be followed for non-highway projects as well.

\section*{1. Needs Identification}

For each of the locations at which an improvement is to be implemented, MassDOT leads an effort to define the problem, establishes project goals and objectives, and defines the scope of the planning needed for implementation. To that end, it has to complete a Project Need Form (PNF), which states in general terms the deficiencies or needs related to the transportation facility or location. The PNF documents the problems and explains why corrective action is needed. For this study, the information defining the need for the project will be drawn primarily, perhaps exclusively, from the present report. Also, at this point in the process, MassDOT meets with potential participants, such as the Metropolitan Planning Organization (MPO) and community members, to allow for an informal review of the project.

The PNF is reviewed by the MassDOT Highway Division district office whose jurisdiction includes the location of the proposed project. MassDOT also sends the PNF to the MPO, for informational purposes. The outcome of this step determines whether the project requires further planning, whether it is already well supported by prior planning studies, and, therefore, whether it is ready to move forward into the design phase, or whether it should be dismissed from further consideration.

\section*{2. Planning}

This phase will likely not be required for the implementation of the improvements proposed in this planning study, as this planning report should constitute the outcome of this step. However, in general, the purpose of this implementation step is for the project proponent to identify issues, impacts, and approvals that may need to be obtained, so that the subsequent design and permitting processes are understood.

The level of planning needed will vary widely, based on the complexity of the project. Typical tasks include: define the existing context, confirm project need, establish goals and objectives, initiate public outreach, define the project, collect data, develop and analyze alternatives, make recommendations, and provide documentation. Likely outcomes include consensus on the project definition to enable it to move forward into environmental documentation (if needed) and design, or a recommendation to delay the project or dismiss it from further consideration.

\section*{3. Project Initiation}

At this point in the process, the proponent, MassDOT Highway Division, fills out a Project Initiation Form (PIF) for each improvement, which is reviewed by its Project Review Committee (PRC) and the MPO. The PRC is composed of the Chief Engineer, each District Highway Director, and representatives of the Project Management, Environmental, Planning, Right-ofWay, Traffic, and Bridge departments, and the MassDOT Federal Aid Program Office (FAPO). The PIF documents the project type and description, summarizes the project planning process, identifies likely funding and project management responsibility, and defines a plan for interagency and public participation. First the PRC reviews and evaluates the proposed project based on the MassDOT's statewide priorities and criteria. If the result is positive, MassDOT Highway Division moves the project forward to the design phase, and to programming review by the MPO. The PRC may provide a Project Management Plan to define roles and responsibilities for subsequent steps. The MPO review includes project evaluation based on the MPO's regional priorities and criteria. The MPO may assign project evaluation criteria score, a Transportation Improvement Program (TIP) year, a tentative project category, and a tentative funding category.

\section*{4. Environmental Permitting, Design, and Right-of-Way Process}

This step has four distinct but closely integrated elements: public outreach, environmental documentation and permitting (if required), design, and right-of-way acquisition (if required). The outcome of this step is a fully designed and permitted project ready for construction. However, a project does not have to be fully designed in order for the MPO to program it in the TIP. The sections below provide more detailed information on the four elements of this step of the project development process.

Public Outreach
Continued public outreach in the design and environmental process is essential to maintain public support for the project and to seek meaningful input on the design elements. The public outreach is often in the form of required public hearings, but can also include less formal dialogues with those interested in and affected by a proposed project.

Environmental Documentation and Permitting
The project proponent, in coordination with the Environmental Services section of the MassDOT Highway Division, will be responsible for identifying and complying with all applicable federal, state, and local environmental laws and requirements. This includes determining the appropriate project category for both the Massachusetts Environmental Protection Act (MEPA) and the National Environmental Protection Act (NEPA). Environmental documentation and permitting is often completed in conjunction with the Preliminary Design phase described below.

Design
There are three major phases of design. The first is Preliminary Design, which is also referred to as the 25 -percent submission. The major components of this phase include full survey of the project area, preparation of base plans, development of basic geometric layout, development of preliminary cost estimates, and submission of a functional design report. Preliminary Design, although not required to, is often completed in conjunction with the Environmental Documentation and Permitting. The next phase is Final Design, which is also referred to as the 75 -percent and 100 -percent submission. The major components of this phase include preparation of a subsurface exploratory plan (if required), coordination of utility relocations, development of traffic management plans through construction zones, development of final cost estimates, and refinement and finalization of the construction plans. Once Final Design is complete, a full set of Plans, Specifications, and Estimates (PS\&E) is developed for the project.

\section*{Right-of-Way Acquisition}

A separate set of Right-of-Way plans are required for any project that requires land acquisition or easements. The plans must identify the existing and proposed layout lines, easements, property lines, names of property owners, and the dimensions and areas of estimated takings and easements.

\section*{5. Programming (Identification of Funding)}

Programming, which typically begins during the design phase, can actually occur at any time during the process, from planning to design. In this step, which is distinct from project initiation, the proponent requests that the MPO place the project in the region's Transportation Improvement Program (TIP). The proponent requesting the project's listing on the TIP can be the community or it can be one of the MPO member agencies (the Regional Planning Agency, MassDOT, and the Regional Transit Authority). The MPO then considers the project in terms of state and regional needs, evaluation criteria, and compliance with the regional Transportation Plan and decides whether to place it in the draft TIP for public review and then in the final TIP.

\section*{6. Procurement}

Following project design and programming of a highway project, the MassDOT Highway Division publishes a request for proposals. It then reviews the bids and awards the contract to the qualified bidder with the lowest bid.

\section*{7. Construction}

After a construction contract is awarded, MassDOT Highway Division and the contractor develop a public participation plan and a management plan for the construction process.

\section*{8. Project Assessment}

The purpose of this step is to receive constituents' comments on the project development process and the project's design elements. MassDOT Highway Division can apply what is learned in this process to future projects.

\section*{Project Development Schematic Timetable}
\begin{tabular}{|c|c|c|}
\hline Description & Schedule Influence & Typical Duration \\
\hline Step I: Problem/Need/Opportunity Identification The proponent completes a Project Need Form (PNF). This form is then reviewed by the MassDOT District office which provides guidance to the proponent on the subsequent steps of the process. & The Project Need Form has been developed so that it can be prepared quickly by the proponent, including any supporting data that is readily available. The District office shall return comments to the proponent within one month of PNF submission. & 1 to 3 months \\
\hline \begin{tabular}{l}
Step II: Planning \\
Project planning can range from agreement that the problem should be addressed through a clear solution to a detailed analysis of alternatives and their impacts.
\end{tabular} & For some projects, no planning beyond preparation of the Project Need Form is required. Some projects require a planning study centered on specific project issues associated with the proposed solution or a narrow family of alternatives. More complex projects will likely require a detailed alternatives analysis. & Project Planning Report: 3 to 24+ months \\
\hline \begin{tabular}{l}
Step III: Project Initiation \\
The proponent prepares and submits a Project Initiation Form (PIF) and a Transportation Evaluation Criteria (TEC) form in this step. The PIF and TEC are informally reviewed by the Metropolitan Planning Organization (MPO) and MassDOT District office, and formally reviewed by the PRC.
\end{tabular} & The PIF includes refinement of the preliminary information contained in the PNF. Additional information summarizing the results of the planning process, such as the Project Planning Report, are included with the PIF and TEC. The schedule is determined by PRC staff review (dependent on project complexity) and meeting schedule. & 1 to 4 months \\
\hline \begin{tabular}{l}
Step IV: Design, Environmental, and Right of Way \\
The proponent completes the project design. Concurrently, the proponent completes necessary environmental permitting analyses and files applications for permits. Any right of way needed for the project is identified and the acquisition process begins.
\end{tabular} & The schedule for this step is dependent upon the size of the project and the complexity of the design, permitting, and right-of-way issues. Design review by the MassDOT district and appropriate sections is completed in this step. & 3 to 48+ months \\
\hline \begin{tabular}{l}
Step V: Programming \\
The MPO considers the project in terms of its regional priorities and determines whether or not to include the project in the draft Regional Transportation Improvement Program (TIP) which is then made available for public comment. The TIP includes a project description and funding source.
\end{tabular} & The schedule for this step is subject to each MPO's programming cycle and meeting schedule. It is also possible that the MPO will not include a project in its Draft TIP based on its review and approval procedures. & 3 to 12+ months \\
\hline Step VI: Procurement The project is advertised for construction and a contract awarded. & Administration of competing projects can influence the advertising schedule. & 1 to 12 months \\
\hline Step VII: Construction The construction process is initiated including public notification and any anticipated public involvement. Construction continues to project completion. & The duration for this step is entirely dependent upon project complexity and phasing. & 3 to 60+ months \\
\hline Step VIII: Project Assessment The construction period is complete and project elements and processes are evaluated on a voluntary basis. & The duration for this step is dependent upon the proponent's approach to this step and any follow-up required. & 1 month \\
\hline
\end{tabular}
